

# Probabilistic-logical Modeling of Music

**Jon Sneyers**, Joost Vennekens, Danny De Schreye

PADL, January 9, 2006

- 1 Introduction**
  - Modeling music
  - Music representation
  - PRISM
  - Hidden Markov Models
- 2 Music Model**
- 3 Experimental results**
  - Classification
  - Generation
- 4 Conclusion**

- 1 Introduction**
  - Modeling music
  - Music representation
  - PRISM
  - Hidden Markov Models
- 2 Music Model
- 3 Experimental results
  - Classification
  - Generation
- 4 Conclusion

# Music genres

4/19

- ▶ Music composers restrict themselves to a genre
- ▶ Music genre is based on certain (unwritten) rules
- ▶ Many formalisms exist for strict rules (e.g. FOL)
- ▶ However: usually genre rules are not strict
- ▶ Solution: a probabilistic approach (using PRISM)

# Music models

5/19

- ▶ Traditional distinction:
  - ▶ Synthetic models: automatic composition
  - ▶ Analytic models: classification
- ▶ General model for both tasks:  
statistical analytic model can be sampled
- ▶ Our goal was to design a model. . .
  - ▶ that can handle polyphonic music (many voices)
  - ▶ that automatically learns probability parameters
  - ▶ that is general (analytic and synthetic)

# What to represent?

6/19

- ▶ “Essential” aspects :
  - ▶ Melody: note pitch/octave
  - ▶ Rhythm: note duration
  - ▶ Polyphony: voices sounding together
- ▶ Ignored aspects:
  - ▶ Dynamics: note volume
  - ▶ Instrumentation
  - ▶ Articulations (accents, staccato vs. legato, ...)

# How to represent?

7/19

## Interwoven Voices List

```
[ (16, [new,new], [55,r]), (16, [old,new], [55,36]),
  (16, [new,new], [60,38]), (16, [old,new], [60,40]),
  (16, [new,new], [59,41]), (16, [old,new], [59,38]),
  (16, [new,new], [60,40]), (16, [old,new], [60,36]),
  (32, [new,new], [62,43]), (32, [old,new], [62,31]) ]
```

- ▶ PRISM: **P**rogramming **I**n **S**tatistical **M**odeling (T. Sato)
- ▶ PRISM = Prolog + probabilistic built-ins
- ▶ Use declarative LP to build complex models from basic probabilistic experiments
- ▶ Includes an efficient built-in EM learning algorithm
- ▶ PRISM program can be used for
  - ▶ Analysis: `prob/2` computes probability of some observation
  - ▶ Synthesis: `sample/1` generates an observation according to the probability distributions

# Hidden Markov Models

9/19

- ▶ a simple HMM:

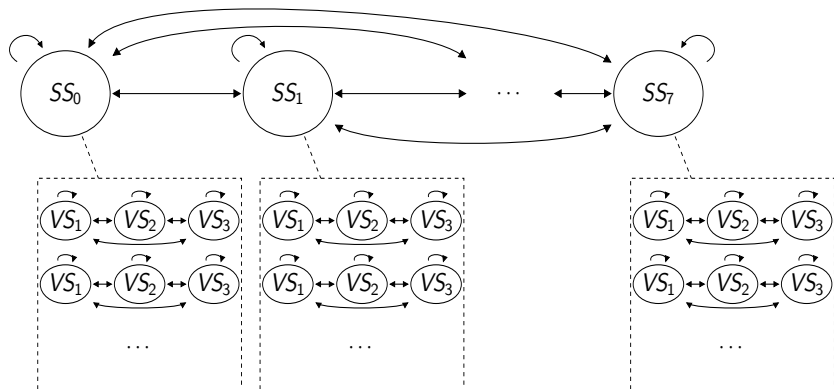

- ▶ HMM's can be modeled using PRISM
- ▶ PRISM's built-in learning algorithm is as efficient as special-purpose learning algorithms for HMM's

- 1 Introduction
  - Modeling music
  - Music representation
  - PRISM
  - Hidden Markov Models
- 2 Music Model
- 3 Experimental results
  - Classification
  - Generation
- 4 Conclusion

- ▶ Global and local structure: *nested HMM*
- ▶ Song state / Voice states

# Overview

12/19

- 1 Introduction
  - Modeling music
  - Music representation
  - PRISM
  - Hidden Markov Models
- 2 Music Model
- 3 **Experimental results**
  - Classification
  - Generation
- 4 Conclusion

# Classification method

13/19

- ▶ Train separate instances of the model for every class (composer)
- ▶ How to classify an unknown piece  $X$ ?
  - ▶ For every model, compute probability of  $X$
  - ▶ Pick class corresponding to model with highest probability

# Classification results

14/19

- ▶ We used 72 training fragments for Bach and 50 for Mozart
- ▶ All 30 unknown fragments are classified correctly
- ▶ ...of which 20 have 3 voices while the training fragments all have 2
- ▶ When ignoring rhythm (durations), 26/30 are classified correctly

# Generation method

15/19

- ▶ Train the model with some training set
- ▶ Sample the model to get “typical” output
- ▶ We can choose the number of voices, song length and first notes

# Generation results

16/19

- ▶ Trained with Bach, two voices, 30 IVL phases:

- ▶ Trained with Mozart, two voices, 30 IVL phases:

- 1 Introduction
  - Modeling music
  - Music representation
  - PRISM
  - Hidden Markov Models
- 2 Music Model
- 3 Experimental results
  - Classification
  - Generation
- 4 Conclusion

- ▶ We have constructed a music model in PRISM
- ▶ it can handle polyphonic music
- ▶ it automatically learns probability parameters
- ▶ it can be used for synthesis and analysis
- ▶ Only took about 150 lines of PRISM code + some conversion scripts
- ▶ Nice application of probabilistic-logical programming

- ▶ Refine the model to include more musical concepts (e.g. meter)
- ▶ Try more structured music representations
- ▶ More thorough experimental evaluation
- ▶ Compare with C(L)P-based techniques
- ▶ Maybe combine both approaches? (e.g. using probabilistic CHR)
