Preface	ix
Acknowledgement	xi
Nederlandse samenvatting	xiii
Contents	liii
Notations	lix
1 Introduction	1
1.1 Situation	1
1.2 Brief overview of existing results	2
1.3 Outline of the thesis	3
2 Stability of DDEs	5
2.1 Introduction	5
2.2 Delay differential equations	5
2.2.1 Classification	5
2.2.2 Existence and uniqueness, state space	7
2.3 Stability and boundedness	7
2.4 Stability in a Lyapunov Framework	9
2.4.1 Method of Lyapunov functionals	9
2.4.2 Razumikhin-type theorems	11
2.5 Autonomous systems	12
I Linear control systems	15
3 The continuous pole placement method	17
3.1 Introduction	17
3.2 Preliminaries	18

3.3	Motivation	21
3.3.1	A finite-dimensional controller for an infinite-dimensional problem	21
3.3.2	Methods based on prediction	24
3.3.3	The two approaches applied to a scalar example	26
3.4	The continuous pole placement algorithm	29
3.4.1	Description of the algorithm	29
3.4.2	Theoretical properties	34
3.4.3	An optimization point of view	35
3.5	Example	36
3.6	The dynamic feedback case	40
3.6.1	Observer based controllers	41
3.6.2	Finite-dimensional dynamic state feedback	43
3.7	MIMO systems	44
3.8	Concluding remarks	46
4	A numerical case-study	49
4.1	Introduction	49
4.2	Characterization of Stabilizable Systems	50
4.2.1	System representation	50
4.2.2	Class of stabilizable systems when $\tau = 1$	51
4.2.3	Class of stabilizable system: the general case	61
4.2.4	Discussion	62
4.2.5	Non-cyclic system matrix	63
4.3	Other approaches	64
4.4	Concluding remarks	67
5	Extensions and applications	71
5.1	Introduction	71
5.2	Other types of linear delay equations	71
5.3	Time-delay compensation in unstable plants	76
5.3.1	Introduction	76
5.3.2	Modifications of the Smith Predictor	77
5.3.3	Example	81
5.3.4	Comparison with static predictors	82
5.4	Dealing with input constrains	84
5.4.1	Introduction	84
5.4.2	Linear low-gain feedback	86
5.4.3	An alternative approach	91
5.4.4	Global stabilization	92
5.5	Conclusions	94

6	The robust stabilization problem	95
6.1	Introduction	95
6.2	Stability radii as robustness measures	96
6.3	Some motivating examples	97
6.4	Optimization procedure	98
6.4.1	Continuity properties	101
6.4.2	Algorithm	102
6.4.3	Calculation of peak values in the singular value plot	103
6.4.4	Reduction of peak values	103
6.4.5	Increasing the number of controlled peak values	105
6.4.6	Stop criterion	107
6.5	Numerical example	107
6.6	Concluding remarks	109
II	Nonlinear control systems	113
7	A Lyapunov approach	115
7.1	Introduction	115
7.2	Preliminaries	118
7.3	The mechanism of destabilizing perturbations	119
7.4	Semi-global boundedness results	125
7.4.1	Controlling the \mathcal{L}_1 and the \mathcal{L}_∞ norm of the perturbation	125
7.4.2	Controlling the shape of the perturbation	129
7.4.3	Boundedness results in a Lyapunov-Razumikhin framework	131
7.5	Stabilization of partially linear cascades	132
7.5.1	LaSalle's Theorem	132
7.5.2	The peaking phenomenon	133
7.5.3	Nonpeaking cascades	137
7.5.4	Peaking cascades	137
7.5.5	Zero dynamics with eigenvalues on the imaginary axis	141
7.6	Conclusions	143
8	A trajectory-based approach	145
8.1	Introduction	145
8.2	Preliminaries	146
8.3	Boundedness results for perturbed DDEs	147
8.4	Comparison	155
8.5	Concluding remarks	157

9	Conclusions	159
9.1	Some final thoughts	159
9.2	Main contributions	160
9.3	Suggestions for further research	161
9.4	Acknowledgements	166
9.5	Work not reported in the thesis	167
A	Stabilization in delay intervals	169
B	Proof of Theorem 5.4.4	173
C	Delay sensitivity of NFDEs	177
C.1	Introduction	177
C.2	Analysis with fixed delays	179
C.2.1	Definitions and notation	180
C.2.2	Rationally dependent and rationally independent delays	181
C.2.3	Special cases	182
C.3	Visualisation and interpretation	183
C.3.1	Non-uniform convergence	183
C.3.2	Unstable difference equations cannot be stabilised . .	184
C.4	Vanishing delays	187
C.4.1	Introductory example	187
C.4.2	Notation	189
C.4.3	Arbitrarily unstable characteristic roots	190
C.4.4	Interpretation and illustration	197
C.4.5	Degenerate case	200
C.5	Largest delays coincide	202
C.6	Applications and examples	202
C.6.1	Boundary controlled PDE	202
C.6.2	Bifurcation diagram: parameter dependence	204
C.7	Conclusions	206
D	Delay sensitivity of Smith Predictors	209
D.1	Introduction	209
D.2	Infinitesimal delay mismatches	212
D.2.1	Instability mechanism	212
D.2.2	Conditions for practical stability	213
D.3	Characterization of stability region	217
D.4	Numerical example	219
D.5	Multivariable case	220
D.5.1	Practical stability condition	222
D.5.2	Stability region	223
D.6	Concluding remarks	224
